

WebSense Enterprise® Client Policy Manager™

WebSense Enterprise® Client Policy Manager™ (CPM) delivers Zero Day protection against unknown security threats and prevents the execution of unauthorized applications. Only CPM enforces employee application use policies for corporate desktops, laptops, and servers with its unique and comprehensive database of categorized applications, which is updated daily. Complementing traditional firewall and anti-virus tools, CPM closes the window of exposure to today's fast-moving and blended security threats.

Today's employee computing environment includes powerful Internet applications and downloads that often introduce new security challenges for corporate IT groups. With an increasingly mobile workplace, employees routinely take their computers home and travel with them. When they reconnect to the corporate network, they risk bringing malware to the network. Organizations need the ability to:

- Detect desktop threats and attempts to use unauthorized applications
- Protect the enterprise from known and unknown security threats
- Prevent unauthorized applications from accessing the network
- Implement and manage application usage policies by category, user, or group

WebSense Enterprise Client Policy Manager Solution

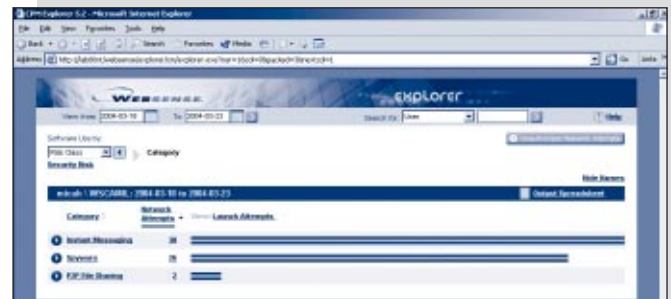

WebSense Enterprise Client Policy Manager is an innovative end-point security solution that extends the power of WebSense Enterprise to corporate desktops, laptops, and servers. CPM delivers Zero Day protection against unknown security threats, including today's sophisticated malware, by preventing their propagation across the network. CPM stops the execution of unauthorized applications, such as spyware, peer-to-peer (P2P) file sharing, and hacking tools. CPM offers flexible policy management of both categories of applications, such as the remote access tools category, and of individual applications, such as AOL® Instant Messenger. Through WebSense® directory integration, these policies can be implemented at a group level or tailored to individual needs.

Complementing traditional firewall and antivirus tools, CPM closes the window of exposure to unknown security threats that often bring down networks before virus signatures or appropriate patches can be deployed or where security systems are misconfigured. Only CPM delivers effective, comprehensive threat detection and flexible application use policy enforcement, enabling organizations to achieve:

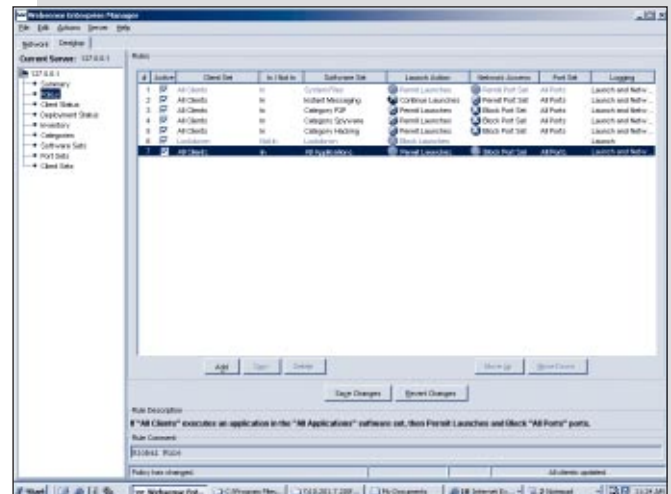

- **Stronger desktop/laptop security** – Stops malware from spreading through the enterprise, leading to higher application and network uptime.
- **Higher employee productivity** – Enables organizations to set appropriate application use policies thus maximizing productivity.
- **Lower desktop management costs** – Reduces help desk and desktop administration costs by eliminating software incompatibilities and their consequent help desk calls.

WebSense Enterprise® Client Policy Manager Benefits:

- Delivers Zero Day protection against unknown security threats.
- Detects and analyzes desktop security threats and application activity.
- Enforces flexible and auto-updating user and group application use policies.

Detect security risks or productivity problems from employee use of applications quickly and easily using WebSense Enterprise Explorer for CPM.

Enforce flexible policies for malicious and unauthorized applications using central management console.

Alert end users when they try to launch insecure executables or unauthorized applications.

Key Features and Benefits

Deliver Zero Day protection against unknown security threats

CPM provides a new and important layer of security for addressing the Zero Day security loophole.

- **Network Access Lockdown** – Delivers Zero Day protection against unknown security threats by blocking application network access to specific ports and protocols by application category.
- **Application Lockdown** – Provides maximum control over desktop environments by allowing only approved applications to run on corporate PCs and servers, thereby preventing unknown, potentially malicious applications from launching.
- **Outbreak Mode** – Enhances enterprise security infrastructure when needed most, during a virus outbreak, before patches and anti-virus updates can take effect. Blocks the launch of specific malware by enabling IT to quickly push policies to PCs in real time.

Detect and analyze desktop security threats and application activity

CPM provides leading-edge threat detection for the corporate desktops.

- **Explorer for CPM** – Detects potential security threats and software misuse with a click-through, interactive, browser-based interface. This dynamic forensic and reporting tool provides business managers with reports on application use and network access attempts by employee, department, date and application category.
- **CPM Reporter** – Automatically schedules and distributes customizable, "out-of-the-box" browser-based reports, including desktop inventories, application launches, software categorizations, historical application usage, and organization risk profiles.
- **Inventory Manager** – Performs critical hardware and software inventories that provide categorized and normalized views of programs and applications, enabling early threat detection and identification of unauthorized applications.

Enforce flexible and auto-updating application use policies

CPM enables users to enforce up-to-date application policies with minimal administration.

- **Application Database** – Categorizes applications within the Websense® Master Database, allowing flexible policies to be

set by user, group, and most importantly, by category using our comprehensive methodology for categorizing thousands of applications into over 50 categories.

- **AppCatcher™/ProtocolCatcher™** – Automatically and anonymously forwards to Websense Master Database any unknown applications and its network behavior at customer sites so that policies stay current.

Integrates seamlessly with existing IT infrastructure

CPM makes it easy to begin managing corporate PCs and enforcing appropriate application policies for end users.

- **Automated desktop agent deployment** – Deploys CPM desktop agents onto corporate desktops individually or globally with the click of a button in Websense Enterprise Manager; there's no need for IT to deal with individual desktops.
- **Seamless integration with Websense Enterprise** – Integrates directly into the Websense Enterprise Manager that manages employee computing across the gateway, network, and desktop, with no new interfaces to learn or consoles to deploy.
- **User Directory integration** – Enables IT administrators to customize policies based on existing user and group network definitions. Interoperates with the existing infrastructure and integrates with popular, user-directory services.

Websense Enterprise v5.2 system requirements

CPM Server

Hardware: Pentium III processor or greater with at least 512 MB RAM. Hardware requirements will vary by configuration. Please see deployment guide for additional information.

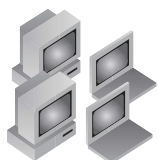

Software: Microsoft® Windows® 2003 Server, Windows® 2000 Server (SP3 or greater) or Windows® NT 4 Server (SP6a or greater).

CPM Client

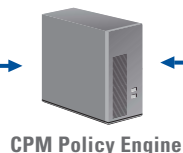

Hardware: CPM client supports most desktop hardware configurations. Please see deployment guide for additional information.

Software: Microsoft® Windows® XP, Windows® 2000, Windows® NT, or Windows® 98 SE, Windows® 2000 Server (SP3 or greater) or Windows® NT 4 Server (SP6a or greater).
